

MNAD B-EX02

1a examples of low level features =

- predominantly white in colors, portrait picture, its a colored picture

examples of high level features =

- it's a picture of a person doing sport
- it's beautiful
- it's a bright photo

Bridging the semantic gap is an attempt to close the disconnect between what the computer perceive (low level features) and what humans perceive (high level features)

b. low level = the level of frequency, the level of volume, the length of the recording

high level = its clearness, its loudness

2a) A multimedia databases handles indexing in both semantic and literal way. For example you may index a video that's from the year "2024" with an exact query but you may also index a video in which "has people in it" and for this reason consequently a multimedia database must have a "machine-learning" prediction style feature extraction capability to handle cases like this.

b) Accounts

Data model: Structured data (SQL)

Embedded links: vide history, acc functionalities, saved information
Video playlist

Data model: Semi-structured data (xpath)

Embedded links: Link unstructured data models, provide structure,
no direct connection to the data

Video recommender:

Data model: Semi-structured (semantic search)

Embedded links: Link unstructured data models, provide structure,
no direct connection to the data

Comment section:

Data model: Structured data model (SQL)

Embedded links: Can break if : - Accounts get deleted
- Video get deleted
