

In-Class Exercise Sheet 10

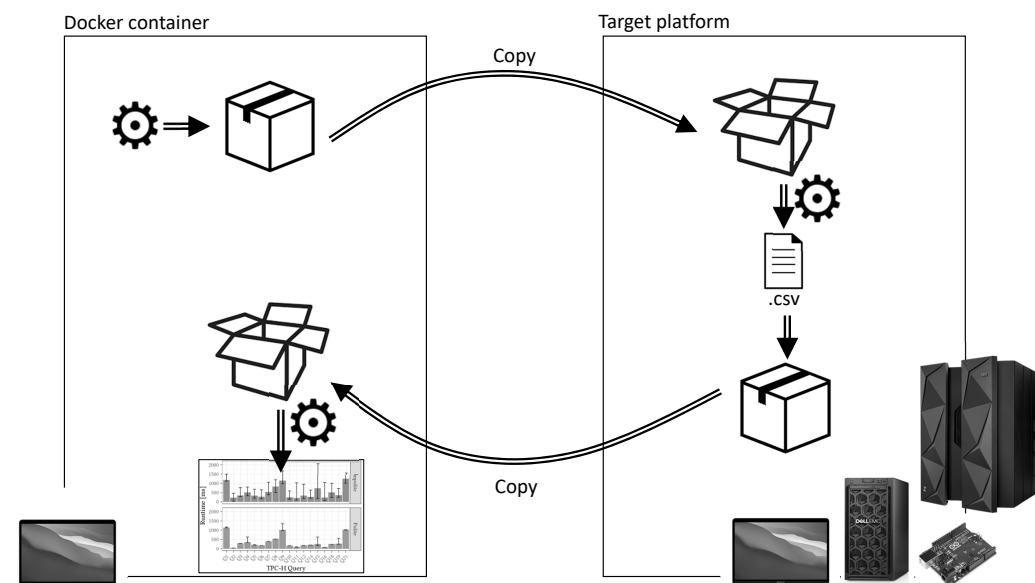

This material originates from the ICDE 2021 tutorial “Nullius in Verba: Reproducibility for Database Systems Research, Revisited” by W. Maurer and S. Scherzinger (material from the slides, accompanying article, and reproduction package).

1. Sometimes, an experiment is not run on the researcher’s laptop, but on some different environment. That environment may not even support running Docker containers!

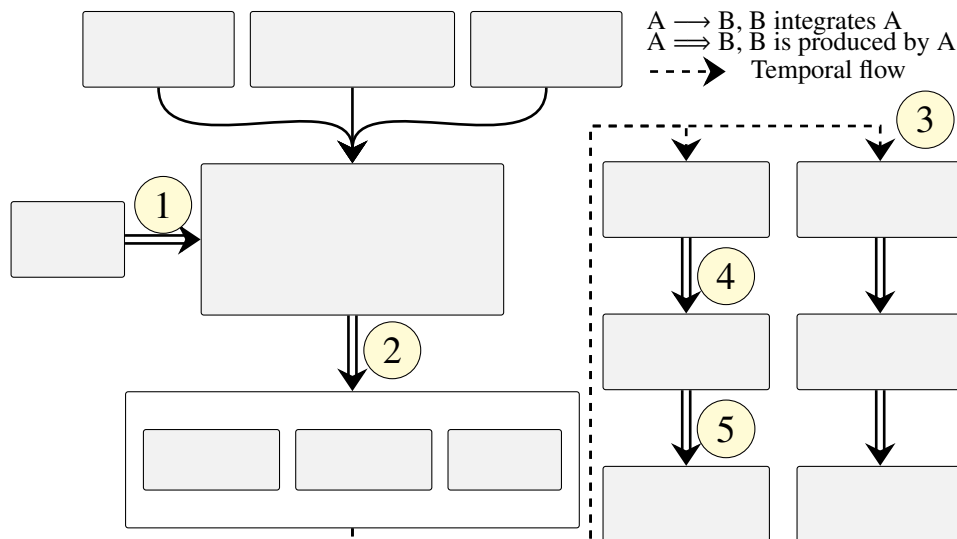

The challenge is to ensure that building the binaries and analyzing the measured data is nevertheless reproducible.

Label the items in the overall workflow shown below. Assign the terms listed below.

build artefacts / experiment execution package / run experiments / measured data / generate graphs and paper

2. Let us consider the technical aspects in greater detail. The illustration below shows dependencies between artefacts and the temporal flow. Label the numbered steps.

Label the numbered actions:

1. _____
2. _____
3. _____
4. _____
5. _____

3. Next, we discuss the slides introducing the SQPolite project (see accompanying slides, available in StudIP) and we walk through the accompanying reproduction package: https://github.com/lfd/icde2021_tutorial.
